

Codeless Connector

Why Codeless Connector

ECM systems become their most useful when they are seamlessly integrated into other applications so that it's functionality can be controlled from the 3rd party application.

Having multiple windows open with different programs can create confusion and inefficiency where data is copied between programs (although human nature dictates this is not always 100% accurate).

Integrating ECM software with other applications usually requires highly skilled programmers and a large amount of resources in both time and expense.

Easy Configuration

This powerful tool needs only seconds to be configured. First, select keyboard or mouse short cuts for indexing, searching and scanning actions.

Then map the Codeless Connector connections to the fields of the third-party application simply by dragging and dropping the target onto the data within the third party application.

Easy to Use

Once configured, users of the third-party applications will be able carry out searches, index and even scan documents to FileDirector from within the third-party application using the predefined Connector shortcuts.

**„Easily link FileDirector
to third-party applications.
No coding, no scripting,
just drag and drop“**

General

 Here you can configure the codeless connectors.
